

Menu-Based Graphical User Interface (GUI) – Web Dashboard

The system uses a **menu-based graphical web interface** where users interact through buttons, forms, and dashboards via a browser.

Justification:

1. Easy For Non-Technical Users

Users such as **administrators or email senders** do not need to learn command syntax.

They simply interact with options like:

- View Processed Emails
- Manage Templates
- View Reports
- Train ML Model

This makes the system **user-friendly and intuitive**.

2. Supports Dashboard-Based Monitoring

The system processes many emails automatically. A **dashboard UI** allows administrators to:

- View processed emails
- Check system logs
- Monitor spam detection
- Review escalated emails

This improves **system transparency and monitoring**.

3. Efficient Navigation Using Menus

4. Compatible With Web Deployment

The system is deployed on **AWS EC2** using a web interface (**Flask/Streamlit**).

A **browser-based GUI** ensures:

- Cross-platform access
- No installation required
- Easy cloud deployment

5. Supports Layered Architecture

The UI interacts only with the **Business Logic Layer through APIs**, ensuring modular design.

This improves:

- maintainability
- security
- scalability.
